

**Table 6.** Summary of recreational catch (landings) for 2000-2001 in pounds for 20 finfish groups, spiny lobster, and conch for the U.S. Caribbean (Puerto Rico and the USVI). Recreational landings from Puerto Rico originated from the MRFSS survey. Recreational reef fish landings for USVI were estimated by forecasting a recreational landings estimate from Jennings (1992). Jennings (1992) estimated non-charter boat recreational landings, which were largely reef fish species, as 54,472 pounds in 1986. Utilizing the same results and approach as Jennings (1992), and applying it to reflect the number of USVI households in 2000 based on United Nations data (i.e., 43,000 households), produces a recreational landings estimate of 85,252 pounds; this does not account for any increase in participation within the recreational sector aside from an increase in population. The percentage of each species (or group) from Puerto Rico's recreational landings were used to derive recreational landings for the USVI (column labeled USVI adj). USVI and Puerto Rico landings were totaled as a best estimate of total U.S. Caribbean landings (last column). For the USVI, the recreational catch for queen conch and spiny lobster was assumed to be 50% of the USVI commercial landings, approximating the same commercial:recreational relationship as for that in Puerto Rico.
