# SEDAR 57

# Caribbean Spiny Lobster Update

CFMC SSC Meeting  
November 29-Dec 1 2022

# Update of the SEDAR 57 assessment benchmark for Puerto Rico, St. Thomas and St. John and St. Croix

## Summary of work conducted by SEFSC

- Provided Overfishing Limit (OFL) and Acceptable Biological Catch (ABC) for 2024-2026 utilizing the already established methods from SEDAR 57 stock assessment
- Specified 2021 as the terminal year for data inputs; Made assumptions for 2022 and 2023 landings, as these are not yet known
- Prepared reports for CFMC SSC Meeting November 29-Dec 1 2022

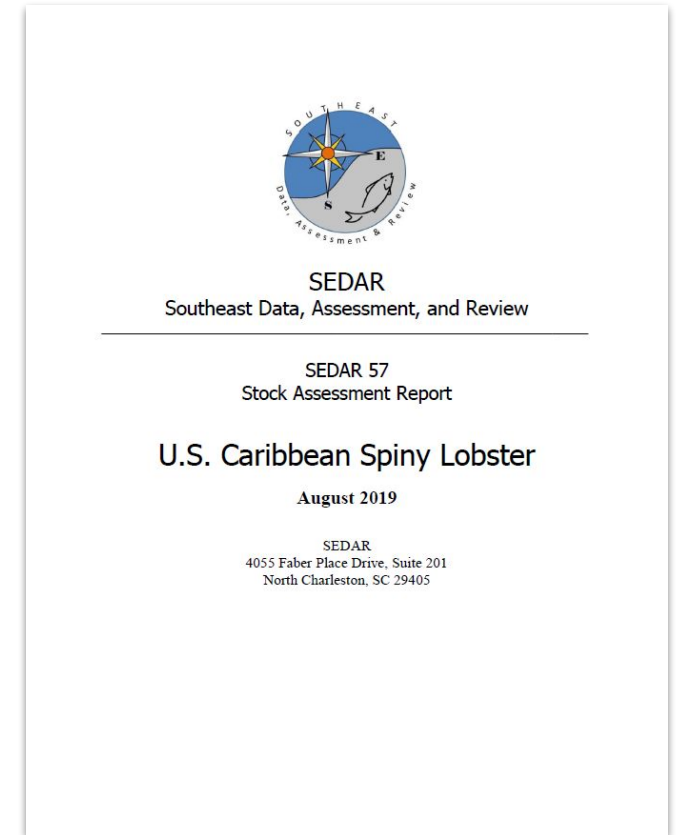

# SEDAR 57 Benchmark Methods

Stock Synthesis (SS) version 3.30 (Methot and Wetzel 2013).

The maximum sustainable yield (MSY) proxy, status determination criteria (SDC), and acceptable biological catch (ABC) were specified using the control rule's third-tier: "Data Limited: Accepted Assessment Available".

MSST was assumed to be 75% of SSPR 30% and the maximum fishing mortality threshold (MFMT) was assumed to be equal to FSPR 30%.

# Overview of SEDAR 57 Update Assessments

## NOVEMBER 2022

### AUGUST 2019 - SEDAR 57 Stock Assessment Report SECTION VI

Benchmark assessment with landings through 2018 and lengths through 2016

### FEBRUARY 2021 - Generic Framework Amendment 1: Spiny Lobster Management Reference Points

- ★ 0. Benchmark assessment with landings through 2020 and lengths through 2016

### NOVEMBER 2022 - SEDAR 57 Stock Assessment Update

1. Benchmark assessment with landings through 2021 and lengths through 2016
2. Update assessment with landings through 2021 and lengths through 2021
- 2b. Update assessment with landings through 2021 and lengths through 2021 with correction factor sensitivity [PR only]
- ★ 3. Update assessment with landings through 2023 and lengths through 2021

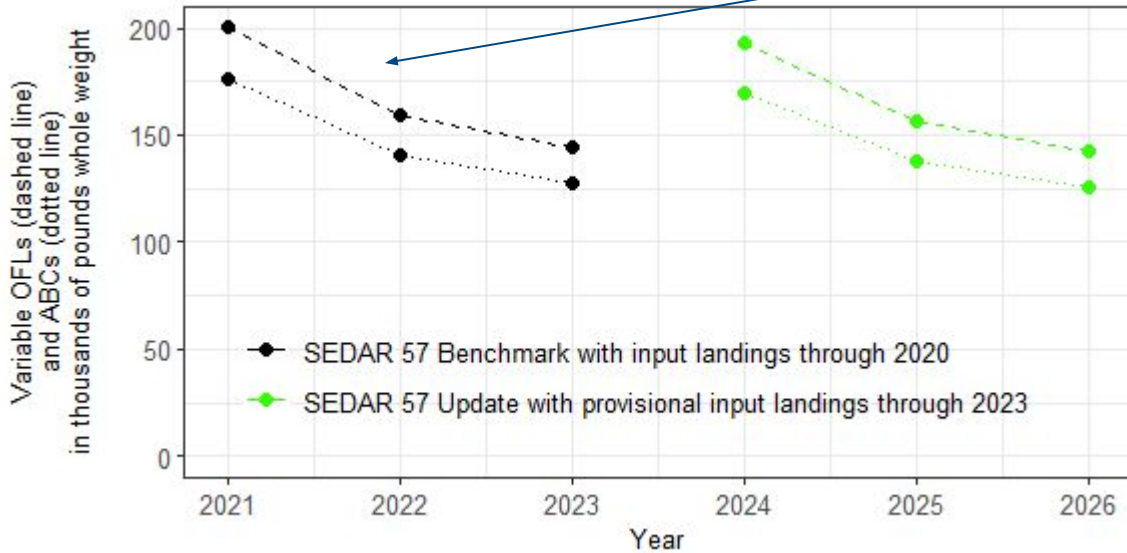

# St. Croix

Caribbean Spiny Lobster variable-catch (annual) OFLs and ABCs for spiny lobster for St. Croix plotted in pounds whole weight. The line color relates to the source of the data. The line type refers to the forecasted values plotted from the stock assessment model projections as OFLs (dashed lines) or ABCs (dotted line).

## Generic Framework Amendment 1: Spiny Lobster Management Reference Points

Source	Year	OFL	Avg. OFL	ABC	Avg. ABC
SEDAR 57 Benchmark with input landings through 2020	2021	200,021	167,898	176,401	148,071
	2022	159,452		140,622	
	2023	144,220		127,189	
SEDAR 57 Update with provisional input landings through 2023	2024	192,631	163,823	169,884	144,478
	2025	156,356		137,893	
	2026	142,483		125,657	

-2.4%

Caribbean Spiny Lobster variable-catch (annual) and constant-catch (average) OFLs and ABCs for St. Croix, based on the Tier 3 of the ABC Control Rule. The column titled "Source" indicates if the rows are associated with the SEDAR 57 Benchmark with input landings through 2020 or with the SEDAR 57 Update with input landings through 2023. All OFLs and ABCs are in pounds whole weight.

# St. Croix

Caribbean Spiny Lobster landings from St. Croix are plotted in pounds whole weight by year and fleet. The color relates to the source of the data. The landings through 2021 are shown in red and the landings from the benchmark assessment through 2020 are shown in black. The values plotted in red overlay the values plotted in black in all years except 2019, 2020, and 2021.

2.5% Lengths  
12% Years

# Puerto Rico

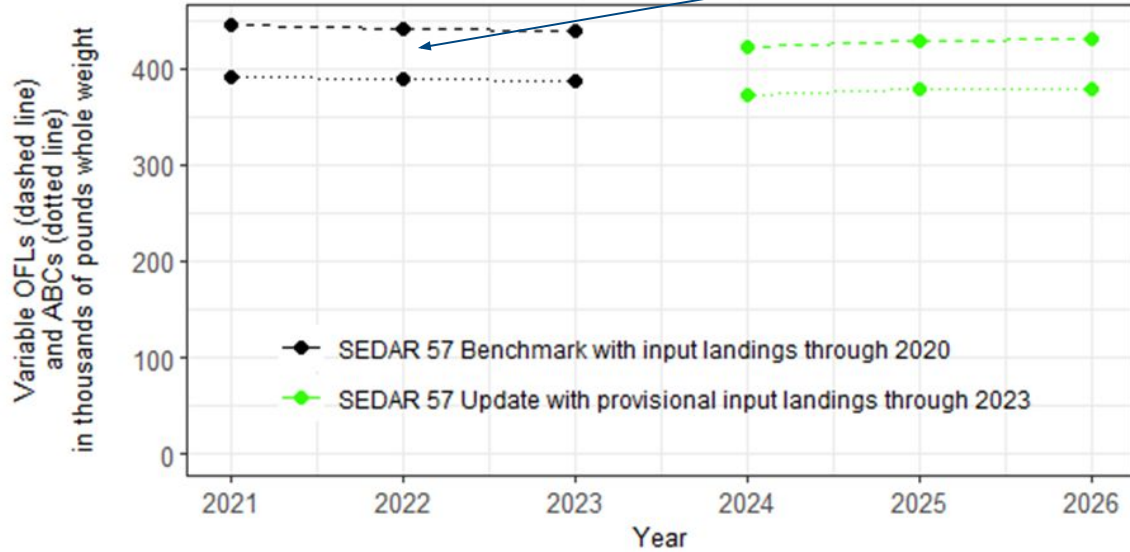

*Revised on 05 December, 2022*

*Sensitivity model results reported in Section 2 and Section 5 were updated with correction factor inputs utilized as intended by the methods described. Compared to the landings with the original 2020 correction factor, the alternative correction factors resulted in changes whereby the trap fleet landings increased by 10.8 and 13.9 percent, while the dive fleet landings decreased by 21.4 and 20.8, for 2020 and 2021 respectively. Previously, this was incorrectly reported as "trap fleet landings increased by 1 and 0.7 percent, while the dive fleet landings decreased by 19 and 16.4, for 2020 and 2021 respectively."*

# Questions

## Life Cycle

● Each egg takes up water and expands until the egg membrane breaks and the new lobster larva is released.

● After hatching, transparent phyllosome (leaf-boulder) larvae can be carried several hundred miles by ocean currents.

● After about a week, the transparent post-larvae takes on the appearance of a miniature adult lobster. The striped and banded color pattern creates a disruption and camouflage the larvae from visual predators. Juvenile lobsters will live within Laurencia until they reach a size of about 45-65 mm CL long.

● Sub-adults start to move to coral reefs and crevices, where they are often found in large groups during the day. It takes lobsters up to 3 years to reach adulthood and start reproducing.

Up to two million eggs may be released by a large female lobster. As few as one, on average, might survive to become an adult.

Adults female with tar spots  
50 - 200 mm CL  
(5.7 - 7.9 in.)

The male attaches a tar-like spermatophore to the underside of the female's carapace. Most reproduction occurs during the late spring, with females producing several clutches of eggs during the reproductive season.

In unfished areas Caribbean spiny lobsters can grow to 200mm CL (7.9 in.) and over 5 kg (11.2 lbs.) in mass. Due to the heavy fishing of the spiny lobster, over 90% of legal sized adults may be harvested annually.

Larval stage  
1.5 mm (0.06 in.)  
approximately  
6-8 months

Phyllosome  
6 - 7 mm carapace length (CL)  
(1 in.) 2-4 weeks

Algal phase juveniles  
6 - 65 mm CL (0.2 - 2.6 in.)  
7-9 months

Sub adult  
45-65 mm CL  
(1.8 - 2.6 in.)  
3 years

# Additional information

## Requested by SSC 11/29

- Mean length by island over time
- 2020 correction factor values
- PR landings time series without correction factors

## Update SSC determinations/decisions

- Include length (TIP) and landings (Logbooks) through 2021
- Start projections in 2024 (2022 and 2023 assumed equal to 2021)
- Use original 2020 correction factor or averages 2014-2019

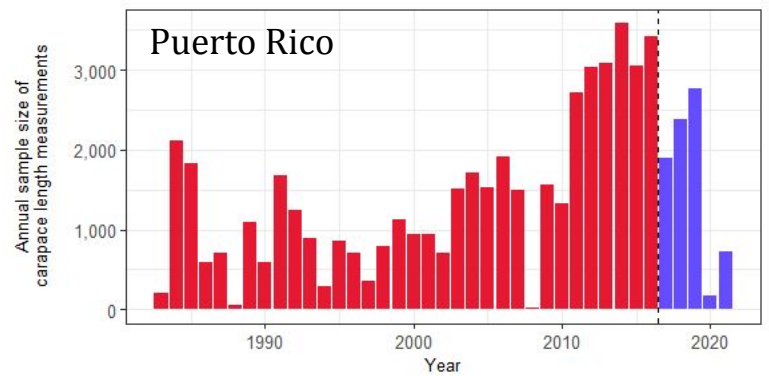

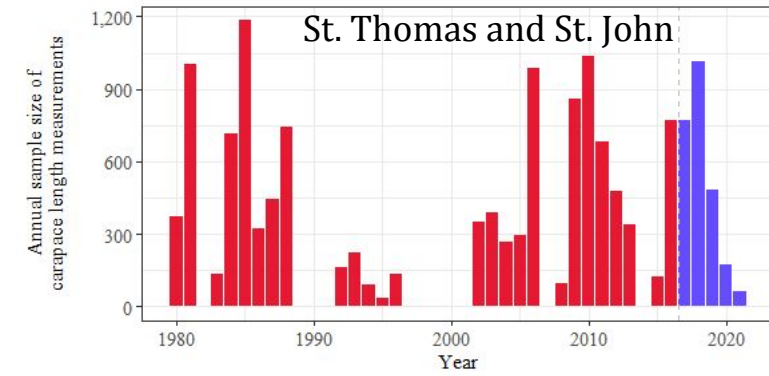

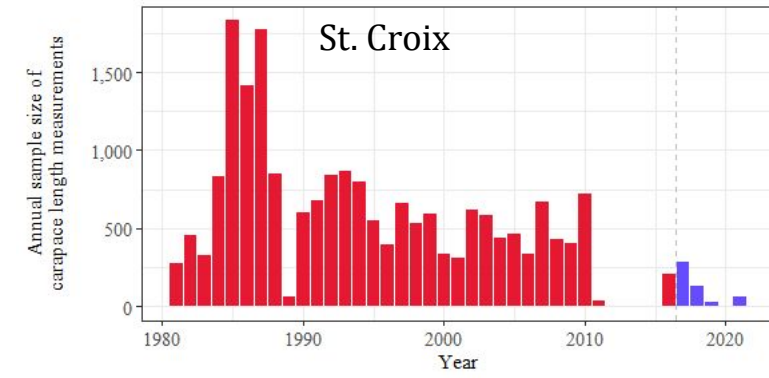

### St. Croix

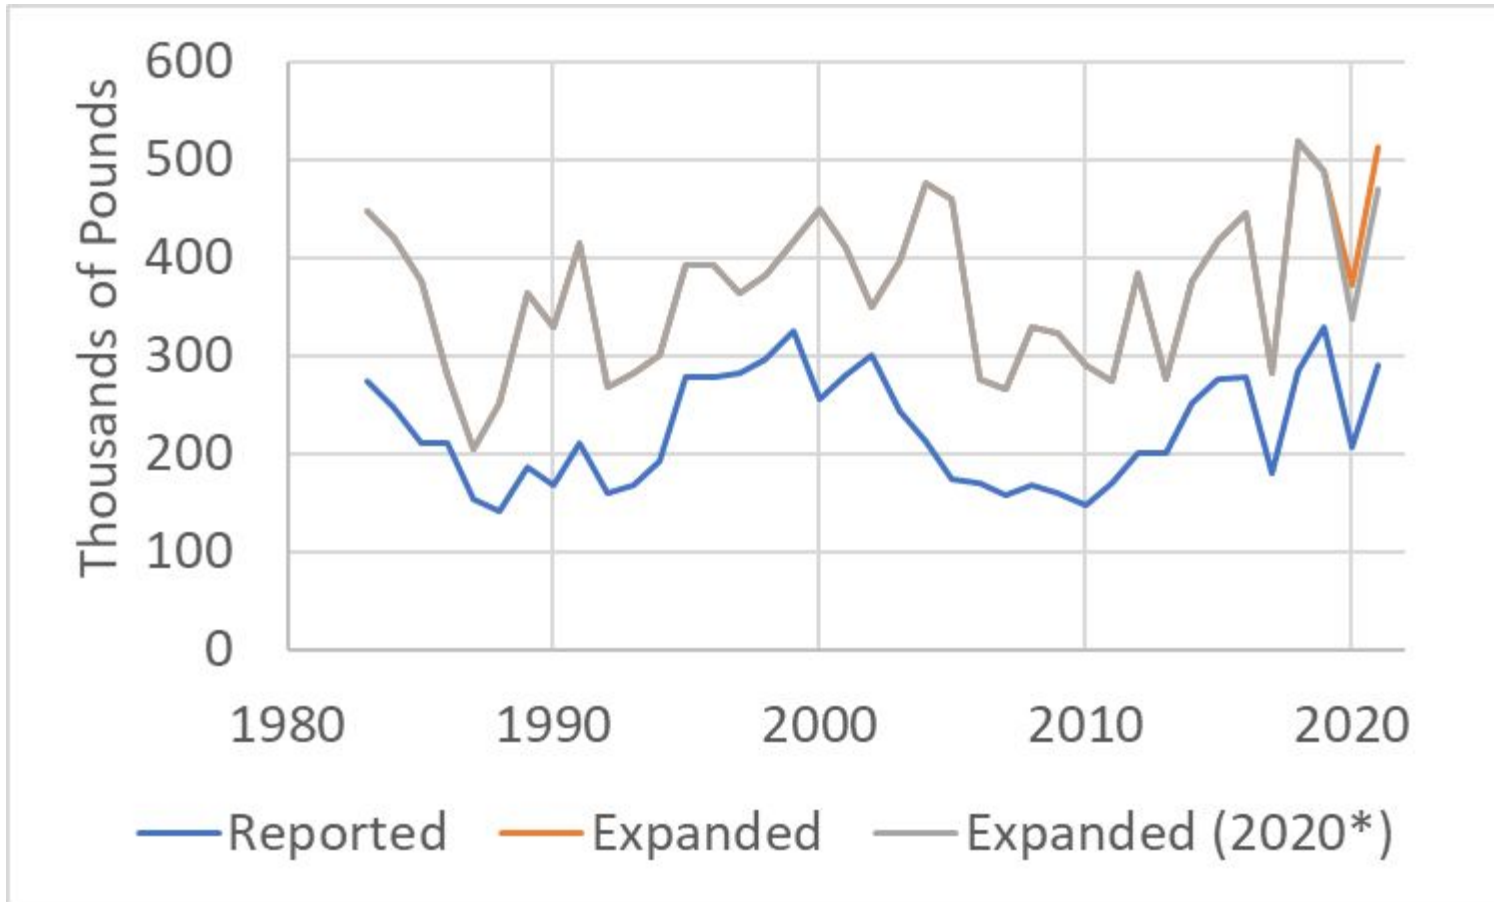

### St. Thomas and St. John

### Puerto Rico
